

SmartXide DOT

Case Report - Scar Treatment

This is a 28 year old male patient who was involved in a car accident 17 years prior. He underwent multiple surgeries and was left with permanent scarring on his right cheek and forehead. The patient was treated on January 26th using the SmartXide DOT from DEKA Medical. Only the right cheek was treated to effect smoothing and softening of the scar. The patient was treated aggressively with settings at a power level of 25W with Dwell time of 1200 microseconds, and DOT spacing of 350 (19.6% density). The patient was seen again on March 16th for a follow up and the scar exhibited visible signs of improvement including reduction in scar depth, discoloration, and texture.
